No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                     February 27, 2002, 11:36:04; Search time 132.19 Seconds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 8, Apply Sequence 10, Apply Sequence 2, Apply Sequence 2,

```

/label= BH /note- "either the natural phenylalanine amino terminus or the Bolton-Hunter modified peptide

g

OTHER INFORMATION: having the group 3-(p-hydroxypenyl)propionyl group

NAME/KEY: Modified-site

```
SEQUENCE CHARACTERISTICS:
LENGTH: 16 amino acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match 80.0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9-JUL-1999
   This sequence represents a peptide that specifically binds to the human D2H protein. The invention relates to purified proteins (1) that bind specifically to at least one of the gastro-intestinal (61) tract receptors human intestinal peptide-associated transporter (HVTI).

**Reproduction intestinal peptide-associated transporter (HVTI).

**Reproduction by the repeutic agents through human and animal GI tissue (into the blood) for in vivo delivery, particularly for treatment or prevention of hypertension, diabetes, osteoporosis, haemophilia, anaemia, cancer, migrande, or angina pectoris. Specifically they are used to cancer, migrande, or angina pectoris. Specifically they are used to are disclosed, including genes or inhibitory nucleic acid, imaging agents and antigens. (1) may also provide targeting to the GI tract. Other uses of (1) are: (1) to determine the level of specified receptors in a sample (in a binding assay); and (ii) to screen for molecules that bind (1). Immunogenic analogues or derivatives of (1) are used to raise antibodies and in immunosasays. The antibodies are used to locate, detect and measure (1), e.g. for imaging monitoring treatment, tissue analysis etc., also for peptide purification and immobilisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter;
New proteins that bind specifically to receptors in the gastro-intestinal tract and related nucleic acid - chimmeras and antibodies, used to deliver therapeutic or diagnostic agents to, or through, the gastrointestinal tract, e.g. insulin or leuprolide
                                                                                                                                                                                                                                                                                                                                                      Ouery Match 88.9%; Score 32; DB 20; Length 39; Best Local Similarity 71.4%; Pred, No. 7; Matches 5; Conservative 0; Mismatches 2; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -NOC-01
                  AAG58145
                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The geminivirus rep gene sequence contains a Cl open reading irame (ORF) which encodes RepA. Rep is the translation product of the spliced Cl and CZ ORFs. Upon transcription and translation, the expressed protein replicase can act in trans to effect rescue and replication of a desired heterologous nucleotide sequence. A pair of nucleic acids comprising a portion of a long intergenic region (LIR) of a geminivirus genome lacking a sequence encoding a geminiviral coal protein, and a nucleic acid comprising a geminiviral replicase gene linked to a fruit ripening dependent promoter, are new. Strains of Escherichia coll and Astrobacterium tumefaciens transfected with an expression vector the production of transgenic plants (or cells). The sequences and methods are useful for amplifying a gene of interest and overproducing a protein

for use in the invention. Removal of the introm greatly enhances bean yellow dwaff virus replication. Upon transcription and translation, the expressed protein replicase can act in trans to effect rescue and replication of a desired heterologous nucleotide sequence. A pair of nucleic acids comprising a portion of a long intergenic region (LIR) of a geminivirus genome lacking a sequence encoding a geminiviral coat protein, and a nucleic acid comprising a geminiviral replicase gene linked to a fruit ripening-dependent promoter, are new. Strains of Escherichia coli and Agrobacterium tumefaciens transfected with an expression vector containing the nucleic acids and a gene of interest are useful for the production of transgenic plants (or cells). The sequences and methods are useful for amplifying a gene of interest and overproducing a protein of interest in recombinant plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Protein identification; signal transduction pathway; melabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter;
                                                                                                                                                                                                                   This is the product of an intronless rep gene sequence from Mastrevirus
                                                           Nucleic acids comprising a portion of a long intergenic region of a genuinivirus genome and a sequence comprising a geniniviral replicase gene, useful for amplifying a gene of interest and overproducing a procein of interest in plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match 80.6%; Score 29; DB 21; Length 335; Best Local Similarity 57.1%; Pred.
